anesthesia was infiltrated in the skin and subcutaneous tissues along the posterior aspect of the right side of the neck over the palpable lymph node. The transverse incision was given along this area. The platysmas muscle was incised along the line of the skin incision. The skin incision was made about 1-inch in length. After opening the platysmas muscle, the dissection was continued along the posterior aspect. The trapezius muscle was identified. It was careful preserved. There is a lymph node, which is visible and very close to this nerve. It is carefully preserved, and the lymph node is dissected from this structure carefully. The specimen was sent for histopathological examination. Hemostasis was completely secured. The platysmas was approximated with 4-0 Monocryl continuous suture. The skin was closed with 4-0 Monocryl subcuticular continuous suture. Dry foam dressing was applied. The patient tolerated the procedure well. Transferred to the recovery room in satisfactory condition.
